CMD188

26-34 GHz Low Noise Amplifier

Features

- ▶ Ultra low noise performance
- ▶ Low current consumption
- ▶ Small die size

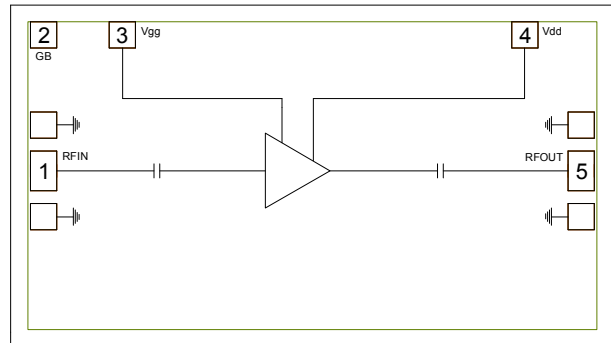

Applications

- ▶ Phased-array radar
- ▶ Point-to-point radios
- ▶ EW subsystems

Description

The CMD188 is a highly efficient GaAs MMIC low noise amplifier ideally suited for EW and communications systems where small size and low power consumption are needed. The device is optimized for 30 GHz and delivers greater than 20 dB of gain with a corresponding output 1 dB compression point of +6 dBm and noise figure of 1.4 dB. The CMD188 is a 50 ohm matched design which eliminates the need for external DC blocks and RF port matching. The CMD188 offers full passivation for increased reliability and moisture protection.

Notes:

1. No connection required for unlabeled pads
2. Backside is RF and DC ground
3. Backside and bond pad metal: Gold
4. Die is 85 microns thick
5. DC bond pads are 100 microns square

Applications Information

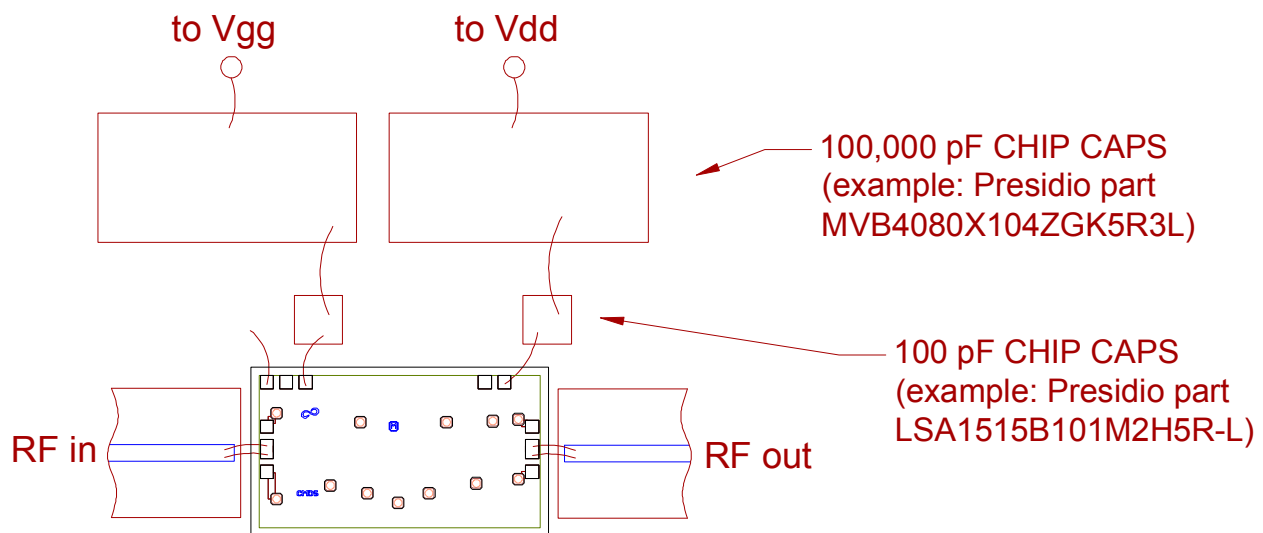

Assembly Guidelines

The backside of the CMD188 is RF ground. Die attach should be accomplished with electrically and thermally conductive epoxy only. Eutectic attach is not recommended. Standard assembly procedures should be followed for high frequency devices. The top surface of the semiconductor should be made planar to the adjacent RF transmission lines, and the RF decoupling capacitors placed in close proximity to the DC connections on chip.

RF connections should be made as short as possible to reduce the inductive effect of the bond wire. Use of a 0.8 mil thermosonic wedge bonding is highly recommended as the loop height will be minimized. The RF input and output require a double bond wire as shown.

The semiconductor is 85 um thick and should be handled by the sides of the die or with a custom collet. Do not make contact directly with the die surface as this will damage the monolithic circuitry. Handle with care.

GaAs MMIC devices are susceptible to damage from Electrostatic Discharge. Proper precautions should be observed during handling, assembly and test.

Applications Information

Biasing and Operation

The CMD188 is biased with a positive drain supply and positive gate supply. Performance is optimized when the drain voltage is set to +2.0 V, though it may be set to a minimum of +1.0 V and a maximum of +4.0 V. The recommended gate voltage is +2.0 V.

Turn ON procedure:

1. Apply drain voltage V_{dd} and set to +2 V
2. Apply gate voltage V_{gg} and set to +2 V

Turn OFF procedure:

1. Turn off gate voltage V_{gg}
2. Turn off drain voltage V_{dd}

RF power can be applied at any time.
