

Features

- ▶ Ultra wideband performance
- ▶ Low insertion loss
- ▶ Wide attenuation range
- ▶ Small die size

Description

The CMD280 is negative controlled, wideband GaAs MMIC 5-bit digital attenuator die which operates from DC to 30 GHz. Each bit of the attenuator is controlled by a single voltage of either 0 V or -5 V. The attenuator bit values are 0.5 (LSB), 1, 2, 4, and 8 dB, for a total attenuation of 15.5 dB. The CMD280 has a low insertion loss of 3 dB at 10 GHz and the attenuation accuracy is typically 0.1 dB step error. The CMD280 is a 50 ohm matched design which eliminates the need for RF port matching. The CMD280 offers full passivation for increased reliability and moisture protection.

Absolute Maximum Ratings

Parameter	Rating
Bias Voltage, V _{ee}	-8 V
Control Voltage, V _{ctl}	-8 V
RF Input Power	+27 dBm
Thermal resistance, Θ_{JC}	125.32 °C/W
Operating Temperature	-55 to 85 °C
Storage Temperature	-55 to 150 °C

Exceeding any one or combination of the maximum ratings may cause permanent damage to the device.

Recommended Operating Conditions

Parameter	Min	Typ	Max	Units
V _{ee}	-5.5	-5	-2.5	V

Electrical performance is measured at specific test conditions. Electrical specifications are not guaranteed over all recommended operating conditions.

Truth Table

Control Voltage Input					Attenuation State RF1-RF2 (dB)
P0 0.5 dB	P1 1 dB	P2 2 dB	P3 4 dB	P4 8 dB	
Low	Low	Low	Low	Low	Reference (insertion loss)
High	Low	Low	Low	Low	0.5
Low	High	Low	Low	Low	1.0
Low	Low	High	Low	Low	2.0
Low	Low	Low	High	Low	4.0
Low	Low	Low	Low	High	8.0
High	High	High	High	High	15.5

Any combination of the above states will result in an attenuation approximately equal to the sum of the bits selected.

Notes:

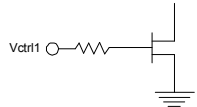

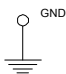

1. No connection required for unlabeled pads
2. Backside is RF and DC ground
3. Backside and bond pad metal: Gold
4. Die is 100 microns thick
5. DC bond pads (2, 3, 4, 5, 6,7) are 80 x 80 microns square
6. RF bond pads (1, 8) are 100 x 150 microns

Applications Information

Assembly Guidelines

The backside of the CMD280 is RF ground. Die attach should be accomplished with electrically and thermally conductive epoxy only. Eutectic attach is not recommended. Standard assembly procedures should be followed for high frequency devices. The top surface of the semiconductor should be made planar to the adjacent RF transmission lines, and the RF decoupling capacitors placed in close proximity to the DC connections on chip.

RF connections should be made as short as possible to reduce the inductive effect of the bond wire. Use of a 0.8 mil thermosonic wedge bonding is highly recommended as the loop height will be minimized. The RF input and output require a single bond wire as shown.

The semiconductor is 100 um thick and should be handled by the sides of the die or with a custom collet. Do not make contact directly with the die surface as this will damage the monolithic circuitry. Handle with care.

Biasing and Operation

The CMD280 has five control lines and a Vee bias port. The CMD280 will not operate unless Vee is applied to the MMIC.

GaAs MMIC devices are susceptible to damage from Electrostatic Discharge. Proper precautions should be observed during handling, assembly and test.
